
Le changement climatique dans la région de Souss Massa (Géoparc Jbel Bani)

Le changement climatique dans la région de Souss Massa (Géoparc Jbel Bani) La région Souss-Massa est l'une des douze nouvelles régions du Maroc instituées par le découpage territorial de 2015. Elle comprend l'ancienne région Souss-Massa-Drâa à l'exception du Drâa et de la province de Sidi Ifni à laquelle se rajoute la province de Tata de l'ancienne région de Guelmim-Es Semara. Découpage géographique Elle est bordée à l'ouest par l'océan Atlantique, au nord par la région de Marrakech-Safi, à l'est par la région du Drâa-Tafilalet, au sud-est par l'Algérie et au sud-ouest par la région de Guelmim-Oued Noun. Son chef-lieu est Agadir. La région est bordée au nord par les massifs du Haut Atlas occidental, suivant la vallée de l'oued Souss, traversée au centre par l'oued Massa et l'Anti-Atlas, bordée au sud par la rivière Drâa. Elle compte au dernier recensement de 2014: 2 676 847 habitants.À la suite de l'entrée en vigueur du récent découpage territorial, objet du décret ministériel 2-15-40, la superficie de la région est réduite à30321km2. Découpage territorial La région de Souss-Massa comprend 2 préfectures et 4 provinces: ? la préfecture d'Agadir Ida-Outanane ? la province de Chtouka-Aït Baha ? la préfecture d'Inezgane-Aït Melloul ? la province de Taroudant ? la province de Tata ? la province de Tiznit Figure 1: Carte administrative de la Région Souss Massa <img alt="carte-3455" src="

style="height:287px; width:500px" /> Figure 1: Carte administrative de la Région Souss Massa Climat Trois facteurs déterminent le climat semi-aride de la région, à savoir le relief, la côte océanique et le Sahara. Ainsi, le nord de la région, dominé par l'Atlas, est caractérisé par un climat humide à semi-aride en progressant vers la plaine. Cette dernière, qui occupe le contrebas du relief de l'Atlas ainsi que les bassins de Souss et de Massa, connaît un climat aride malgré une large ouverture sur l'Atlantique. Enfin, la partie sud et sud-est de la région qui compose le côté nord du Sahara est couverte par un climat désertique Les précipitations dans la plaine du Souss ont atteint en moyenne 2506mm sur les 10 dernières années, et 350 à 400 mm sur les hauts plateaux7, 8. Le sud de la région, en bordure du Sahara, est beaucoup plus sec mais depuis 2005 le désert a tendance à reverdir grâce à de fortes pluies hivernales notamment en 2009-2010. Les zones inondables dans la région Souss Massa L'inventaire des sites présentant un risque d'inondation a permis de recenser, au niveau de la région 128 sites avec des degrés de risque variés. Une situation à risque résulte en fait d'une incompatibilité entre les niveaux respectifs d'un aléa d'inondation et un niveau de vulnérabilité (Rapport régional sur l'état de l'Environnement, OREDD Agadir). Figure 1: Nombre de points inondables selon les préfectures et provinces <img alt="PDAIRE "

AAAAABJRU5ErkJggg==" style="height:275px; width:500px" /> Source: PDAIRE du Bassin Souss Massa et du bassin Drâa (modifié) >> Zones inondables dans la Province de Tata La province de Tata est une zone exposée aux risques d'inondations des pluies torrentielles du fait que toutes les villes de la province sont dépourvues d'un système d'évacuation des eaux de pluies, donc toutes les rues sont parsemées de fosses septiques aux pieds des murs d'habitations ce qui favorise les phénomènes d'inondations et les épuisements. Les risques les plus importants sont liés aux crues des pluies venant de l'Anti-Atlas, le débordement des oueds de leurs lits en détruisant les ponts, les radiers, les routes, les maisons et l'agriculture. Les zones vulnérables sont cartographiées selon leur niveau de vulnérabilité (figure 1): <span

style="font-size:14px">? Fort (concerne les communes avec plus de 80% de la population en zone inondable), ? Moyen (pourcentage population en zone inondable entre 40 et 80%) ? Faible (communes avec pourcentage population en zone inondable entre 20 et 40%) ? Très faible (communes avec moins de 20% de la population en zone inondable) ? Nulle (communes non inondables) Figure 2: Carte de vulnérabilité communale aux inondations (Basée sur la densité des populations) Source Protection civile Tata <img alt="vulnérabilité "

Décembre 2009: La pluviométrie du mois de décembre 2009 relevée au niveau de la ville de Taroudant a dépassé la moyenne annuelle de cette ville. Il en est de même pour Tiznit qui a légèrement surclassé le record du mois. Les hauteurs maximales journalières relevées au cours de ce mois ont atteint des valeurs importantes au niveau des villes de Taroudant, et Sidi Ifni. Les précipitations journalières étaient de l'ordre de 51 mm à Agadir et Taroudant enregistrées le 21 et 22 décembre alors que Tiznit a reçu 39 mm le 24 du même mois. • Février 2010: Comme ce fut le cas lors du mois de décembre 2009, la pluviométrie du mois de février 2010 relevée au niveau de la ville de Taroudant a dépassé la moyenne annuelle de cette ville et a enregistré un nouveau record pour ce mois. Globalement l'année pluviométrique 2009-2010 a enregistré, au niveau de plusieurs stations, des dépassements de la moyenne des précipitations de la décennie découlé. Figure 3: Précipitations2008/2009 par rapport à la moyenne des dix dernières années
